

WIRING GUIDE

***ACTUAL MODEL MAY ONLY
HAVE SINGLE PUMP**

REQUIREMENTS:

All Wind River Spas Require a 220v, 50Amp dedicated G.F.C.I. protected circuit. The wire can enter the spa in one of two ways (pictured above). When entering through the cabinet of the spa, it is preferred to enter through one of the four corners – they will never need to be removed for serviceability. When entering through the bottom of the spa, pick any of the four corners and follow the diagram above by creating a 5"x5" square to find the best spot – we intentionally leave this space open for this reason. Please inquire with your salesman if further clarification is needed.

Recently, the industry has been seeing premature failures with specific branded breakers, mainly Eaton brand as well as ABB branded breakers (specifically with the red GFCI test button). We would recommend avoiding these if possible to avoid potential intermittent tripping breaker issues early in the life of the spa
